Study Design/Methodology

This was a multi-center, open-label, dose finding, phase I study of oral single agent HDM201, administered in subjects with wild-type TP53 advanced tumors (solid and hematological) who had progressed despite standard therapy or for whom no standard therapy existed.

The study consisted of a dose escalation part, to determine the maximum tolerated dose (MTD) and/or recommended dose for expansion (RDE) of HDM201, and a dose expansion part to further characterize anti-tumor activity of HDM201 in a specific regimen. In addition, the study also included a dose escalation part, in solid tumor subjects only, with HDM201 administered in combination with eltrombopag.

Four dosing regimens (1A, 1B, 2A, 2C) at different dose-levels were explored.

Centers

15 centers in 8 countries: Spain(2), Taiwan(1), United States(2), Singapore(1), Germany(3), Netherlands(2), Japan(2), France(2)

Objectives:

The primary objective of the trial was to determine the MTD and/or to identify the RDE of HDM201 with or without eltrombopag in one or more of the pre-defined regimens and indication group. The following related endpoint was assessed:

- Incidence of Dose Limiting Toxicities (DLTs) during the first cycle of treatment

Clinical Trial Results Website

The secondary objectives were:

- To characterize the safety and tolerability of HDM201 with or without eltrombopag in terms of:
 - Incidence of adverse events (AEs) and serious adverse events (SAEs)
 - Number of participants with dose reductions or dose delays
 - Dose intensity
- To characterize the pharmacokinetics (PK) properties of HDM201
- To assess the pharmacodynamic effect of HDM201 by measuring the changes from baseline of pharmacodynamic biomarkers (GDF-15 in serum and p21 in tumor tissue)
- To assess the preliminary anti-tumor activity of HDM201 in solid tumors according to Response Evaluation Criteria in Solid Tumors version 1.1 (RECIST v1.1) in terms of:
 - Number of participants with Best Overall Response (BOR)
 - Duration of response (DOR)
 - Progression-free survival (PFS)
- To assess the preliminary anti-tumor activity of HDM201 in hematological malignancies according to hematological malignancy response criteria in terms of:
 - Number of participants with Best Overall Response (BOR)
 - Duration of Response (DOR)

Test Product (s), Dose(s), and Mode(s) of Administration

HDM201 was used as an investigational product in this study. HDM201 was supplied as hard gelatin capsules of dosage strengths of 1 mg, 2.5 mg, 10 mg and 100 mg. Eltrombopag was administered orally in combination with HDM201 in participants with solid tumors in a few arms of the study.

Four dosing regimens (1A, 1B, 2A, 2C) of HDM201 administered orally at different dose-levels were explored in the 29 cohorts of the study.

In regimen 1A the following doses of HDM201 were assessed:

- 12.5 mg, 25 mg, 50 mg, 100 mg, 200 mg, 250 mg, 250 mg + eltrombopag and 350 mg in participants with solid tumors.
- 250 mg, 350 mg and 400 mg in participants with hematological malignancies.

- Regimen 1B: HDM201 once a week for the first 2 weeks of a 4 week-cycle (on Day 1 and on Day 8 of a 28 day-cycle).

In regimen 1B the following doses of HDM201 were assessed:

- 120 mg, 150 mg, 150 mg + eltrombopag and 200 mg in participants with solid tumors.
- 120 mg and 150 mg in participants with hematological malignancies.

- Regimen 2A: HDM201 once daily dosing for the first 2 weeks of a 4 week-cycle (2 weeks on treatment, 2 weeks off treatment).

In regimen 2A the following doses of HDM201 were assessed:

- 1mg, 2 mg, 4 mg, 7.5 mg, 15 mg and 20 mg in participants with solid tumors.
- 20 mg and 30 mg in participants with hematological malignancies.

- Regimen 2C: HDM201 once daily dosing for the first week of a 3 week-cycle (1 week on treatment, 2 weeks off treatment).

In regimen 2C the following doses of HDM201 were assessed:

- 15 mg, 20 mg and 25 mg in participants with solid tumors.
- 45 mg in participants with hematological malignancies.

Clinical Trial Results Website

Participants could continue treatment with the study treatment until participant experienced unacceptable toxicity, disease progression and/or treatment was discontinued at the discretion of the investigator or the participant.

Statistical Methods

The primary variable was the incidence of DLTs in the first cycle of treatment. Estimation of the MTD was based upon the estimation of the probability of a DLT in the first cycle of treatment for subjects in the dose-determining set. An adaptive Bayesian logistic regression model (BLRM) guided by the escalation with overdose control principle guided the dose escalation of treatment with HDM201 to its MTD and/or RDE for each regimen separately. A two-parameter BLMR was fitted on the first cycle of treatment dose-limiting toxicity data (i.e. absence or presence of DLT) accumulated throughout the dose escalation to model the dose-toxicity relationship of HDM201.

Local read of Computed tomography/Magnetic resonance imaging (CT/MRI) assessments was used for all efficacy assessments of solid tumor activity on study.

Best overall response (BOR), progression-free survival (PFS), and duration of response (DOR) was defined as per RECIST 1.1 for subjects with solid tumors.

Evidence of anti-leukemic activity of HDM201 on subjects with hematological malignancy were evaluated using BOR and DOR, as per the hematological malignancy response criteria.

For all safety analyses, the safety set including all subjects who received at least one partial or full dose of HDM201 and had at least one valid post-baseline safety assessment was used.

Study Population: Key Inclusion/Exclusion Criteria

Conclusion:

The primary objective of the study was to determine the MTD and/or identify the RDE of HDM201 with or without eltrombopag in one or more of the pre-defined regimens and indication groups. The study objectives of the study were met. Different RDEs have been defined in the first-in-human study: RDE 120 mg regimen 1B (Day 1, Day 8, 4-week cycle) in both solid tumors and hematological tumors; in addition, RDE 45 mg regimen 2C (Day 1-8, 4-week cycle), and RDE 250 mg regimen 1A (Q3W) in hematological tumors, only.

HDM201 has demonstrated a tolerable safety profile mainly characterized by bone marrow suppression and gastrointestinal (GI) toxicity. Whereas GI toxicity was of mild and moderate severity, hematological toxicity was of higher incidence and severity with a limited effect of eltrombopag on the mitigation of HDM201-induced thrombocytopenia. However, both toxicities were manageable in practice with hematological toxicity being very rarely dose limiting.
